

ANY_ROBOT

How to launch

```
pip install uv
```

```
uv run any_robot.py --robot h1_2
```

[g1, h1_2, h1] - available options (better if h1_2 or g1)

- Voice control 2 robots:
Key V to launch the dialog with realtime llm

```
uv run any_ag_micro.py
```

- 3 twin-robots:

```
uv run any_3h1_2.py
```

- The best version with avoiding obstacles by A*:

```
uv run any_robots_map.py
```

How does it works?

VLM receives a prompt with a full description of the robot, the values and names of the current joints, and a command given by the user in natural language.

VLM returns a json array with the joints and the angle values to set them to.

For example: the command "Raise your right hand up" is expected to do something like:

```
[
{
  "frame": [
    {"name": "right_shoulder_pitch_joint", "angle": -185},
    {"name": "right_elbow_joint", "angle": 90}
  ],
```

```
"duration": 1  
}  
]
```
